

## Cessna 310

### Cargo Barrier (Behind Crew Seats)

DIAGRAM FOR ILLUSTRATION ONLY

The **Aeronautical Engineers Australia** Cessna 310 Cargo Barrier is applicable for use on all 310 model aircraft. The barrier allows the aircraft to be used for cargo carrying operations, securing goods behind the crew seats.

The barrier attaches to the existing aircraft seat rails and additional hardpoints installed in the cabin roof and walls. The barrier uses a Cordura mesh between the webbing to restrain small articles. This gives a maximum load bearing capacity of 280 kg or 617 lbs. The net can then be easily removed for conversion to passenger carrying or other configurations.

The supplied kit contains the barrier, shackles, and all supporting documentation for CASA Australia approval. Separate approval is required for FAA, JAA or other international air safety jurisdictions. The hardpoints require installation by a CASA approved workshop and the aircraft may also require an approved loading system for cargo operations.
