

Cargo Throwover Net

DeHavilland Canada DHC-8 Series

Introduction

The **Aeronautical Engineers Australia** DeHavilland DHC-8 Series Cargo Throwover is applicable for use on most DHC-8 model aircraft. The throwover net allows the cabin of the aircraft to be used for cargo carrying operations, securing goods to the aircraft floor.

Modifications

The net attaches to the 16 existing aircraft hardpoints and seat tracks and uses a Cordura mesh to restrain small articles between the webbing. This gives a maximum load bearing capacity of 720 kg or 1587 lbs. The net can then be easily removed for conversion to passenger carrying or other configurations.

The supplied kit contains the net, shackles and all supporting documentation for CASA Australia approval. Separate approval is required for FAA, JAA or other international air safety jurisdictions. The aircraft may also require an approved loading system for cargo operations.

Installation View

Experience

Aeronautical Engineers Australia has over 30 years of experience in the design and manufacture of aircraft systems and has installed these systems on a wide range of aircraft with numerous examples in service around Australia.
