

# Cargo Throwover Net

## Beech Baron Series 55/58/95

### Introduction

The **Aeronautical Engineers Australia** Beech Baron Series Cargo Barrier is applicable for use on Baron 55, 58 and 95 model aircraft. The barrier allows the cabin of the aircraft to be used for cargo carrying operations, securing goods to the floor of the aircraft.

### Modifications

The throwover net attaches to hardpoints fitted using the aircraft's existing seat tracks and seat belt attachment points, and uses a Cordura mesh to restrain small articles between the webbing. This gives the net a maximum load bearing capacity of 400 kg or 882 lbs. The throwover net can then be easily removed for conversion to passenger carrying or other configurations.

The supplied kit contains the throwover net, shackles, and all supporting documentation for CASA Australia approval. Separate approval is required for FAA, JAA or other international air safety jurisdictions. The hardpoints require installation by a CASA approved workshop and the aircraft may also require an approved loading system for cargo operations.

### Installation View

### Experience

**Aeronautical Engineers Australia** has over 30 years of experience in the design and manufacture of aircraft systems and has installed these systems on a wide range of aircraft with numerous examples in service around Australia.
